
website: – web sitesi forum: – forumu blogs: – bloglar However, when I try to access the.md file, it opens a standard Microsoft word file. The same thing happens when I use the function `convert.to_md()` from `filehelpers.cli_`. Let's explore a solution for this problem. ## Retrieving data from files We can find the raw text of a file in the `_.txt_` format with the `read_text()` function. If we save the result in a variable, we can use it to reformat it with `to_md()`. Let's first try it with a simple text file stored in the working folder: \$ `**python -m SimpleHTTPServer**` `**Serving HTTP on 0.0.0.0 port 80...**` `**127.0.0.1 - - [23/Jun/2013 13:35:31] "GET / HTTP/1.1" 200 -**` If we open the `_index.html` file in the working folder, we get the following text: This is a simple test. We can also use the `read_text()` function to retrieve the contents of this file: In [8]: `>>> **import filehelpers**` In [9]: `>>> **print filehelpers.read_text('index.html')**` Since we just got the raw text of the file, we will need to process it to get the text that will be displayed on the Web. We will need to get rid of the HTML that is associated with the file. 82157476af
